                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            zvegf2 protein in a dimeric form acts as a mitogen for fibroblasts or smooth muscle cells. zvegf2 is claimed to be useful for stimulating the revascularisation of tissue or the re-endothelialisation of vascular tissue. zvegf2 is particularly claimed to be useful for the treatment of full-thickness skin wounds, including venous stasis ulcers and diabetic ulcers. The zvegf2 protein is also claimed to be useful as an additive in tissue adhesives for promoting revascularisation of the healing tissue. Antagonists against zvegf2 can be used to block its mitogenic, chemotactic and angiogenic effects. The antagonists may therefore be useful for reducing growth of solid tumours by inhibiting neovascularisation of the developing tumour or by directly blocking tumour cell growth, in the treatment of diabetic retinopathy, psoriasis,

                                                            in the lung and/or gaseous exchange between the lungs and the blood stream or to improve blood circulation to the heart and 02 gas permeability in cases of cardiac insufficiency, to improve blood flow and gaseous exchange in chronic obstructive airway disease, or to treat malabsorptive syndromes in the intestinal tract. Quantitation of VEGF-D in cancer biopsy specimens may be useful as an indicator of future metastatic risk Antagonists can be used for treating e.g. conditions such as congestive heart failure, involving accumulations of fluid in the lung resulting from
                                                                                                                                                                                                                                                                                                                                                                                    products

                                                                                                                                                                                                              The sequence is that of human lung vascular endothelial growth factor D (VEGF-D). VEGF-D can be used for e.g. acceleration of angiogenesis in wound healing, tissue or organ transplantation, or to establish collateral circulation in tissue infarction or arterial stenosis, such as coronary artery disease, and inhibition of angiogenesis in the treatment of cancer or of diabetic retinopathy. It can also be used in the treatment of lung disorders to improve blood circulation and the treatment of lung disorders to improve the second circulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              transplants; collateral circulation; infarction; arterial stenosis; coronary artery disease; inhibition; cancer; treatment; diabetic retinopathy; lung disorders; blood circulation; gaseous exchange; chronic obstructive airway disease; intestinal malabsorptive syndrome; blopsy; metastatic risk;

                                                                       The present sequence represents human vascular endothelial growth fa (VEGF-D). The VEGF-D protein, compounds and antibodies, which can the protein, may be useful in, e.g. gene therapy and in treatment of inflammation and oedema. Vectors, containing the VEGF-D DNA, and VEGDNA sequences may be used for screening for the compounds which bind

                                                                                                                                                                                                                                                            22-DEC-1998;
18-MAR-1999;
08-NOV-1999;
This invention describes a novel vascular endothelial growth factor-X (VEGF-X) protein (Ia) and its encoding polynuclectide (IIa) which has vulnerary, cytostatic, antirhematic, antirathritic, antipsoriatic and antidiabetic activity and acts as an angiogenesis and vascularization regulator. An antisense molecule of the invention is useful for treating or preventing cancer, rheumatoid arthritis, psoriasis and diabetic
                                                                                                                                                                                                                                                                                                                                                                                                                VEGF-X; vascular endothelial growth factor; human; vulnerary; cytostatic antirheumatic; antiarthritic; antipsoriatic; antidiabetic; treatment; angiogenesis regulator; vascularistoriatic; regulator; cancer; psoriasis; rheumatoid arthritis; diabetic retinopathy; blood vessel; organ repair; tissue regeneration; tissue repair; wound; dermal ulcer; pressure sore; venous sore; diabetic ulcer; burns; skin graft growth; VEGD.
                                                                                                                  New vascular endothelial growth factor protein, useful for treating preventing diseases associated with inappropriate angiogenesis activ such as cancer, rheumatoid arthritis, psoriasis and wounds -
                                                                                                                                                                                                                                                                                                                21-DEC-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ and tissue repair in a subject. The products of the invention are useful for preparing medicaments for treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic ulcers and burns and to promote skin graft growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair by promoting angiogenic activity or vascularization. This sequence represents the human VECD protein used to illustrate the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is the protein sequence of the human vascular endothalial growth factor D (VEGF-D). It was used to demonstrate the methods of the invention, which involve the screening of individuals to determine which vascular endothalial growth factor receptor 3 (VEGFR-3, also known as Fl14 or fms-like tyrosine kinase 4) alleles they possess and thus their likelihood of developing hereditary lymphoedema. Conditions associated with lymphoedema include Milroy-Nonne syndrome, which is early onset lymphoedema and lymphoedema praecox, which is late
                                                                                                                                                                             Human prepro-vascular endothelial growth factor
                                                                                                                                                                                                                                                                                 AAY70750

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC referred as vascular endothelial growth factor receptor-3, VEGFR-3) in CC endothelial cells of blood vessels adjacent to malignant neoplasm. The CC method involves administering a compound that inhibits binding of a CC ligand to Flt4 thereby inhibiting Flt4 mediated proliferation of vascular CC endothelial cells. The compound is useful for treating neoplastic disease CC such as breast carcinomas, squamous cell carcinomas, lymphomas, melanomas CC and sarcomas. Flt4 receptor tyrosine kinase binding compounds can be used CC for manufacturing medicament useful for diagnostic screening, imaging and CC treatment of malignancies characterised by Flt4-expressing blood cells. CC The Flt4 gene maps to chromosomal region 5q35 and is expressed as 5.8 kb CC and 4.5 kb mRNAs which differ in their 3' sequences and are CC differentially expressed in HEL and DAMI cell lines. Flt4 CC belongs to a subfamily of class III receptor tyrosine kinases (RTKs). CC The present sequence is a human prepro-vascular endothelial growth CC factor D (VEGF-D), a specific example of Flt4 binding compound. A CC recombinantly matured VEGF-D lacking residues 1-92 and 202-354 CC retains the ability to activate VEGFR-2 and VEGFR-3 receptors and CC associate as non-covalently linked dimers.

VEGF-D has the ability to stimulate re-endothelialisation of an injured blood vessel, without significant stimulation of smooth muscle cell proliferation. It can bind to and stimulate VEGFR-2 (vascular endothelial growth factor receptor) and/or VEGFR-3 phosphorylation in cells that express such receptors. An anti-restenosis agent comprising either a VEGF D gene or protein is used in a method to reduce or prevent restenosis and stenosis of a blood vessel following vascular trauma e.g., cardiovascular surgery and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a method for screening a human subject CC for an increased risk of developing a lymphatic disorder e.g. hereditary CC lymphedoema. The method comprises assaying nucleic acid of a human CC subject to determine a presence or an absence of a mutation altering the sequence or expression of vascular endothelial growth factor receptor-3 CC (VEGFR-3)/fms-like tyrosine kinase 4 (Flt4) allele (see AAC68952 and CC AAB37604) and determining an increased risk of developing lymphatic CC disorder from presence or absence of the mutation. The presence of a cc mutation altering the encoded amino acid sequence or expression of at CC least 1 VEGFR-3 allele in the nucleic acid sourclates with an increased crisk of developing a lymphatic disorder. Treatment for hereditary CC lymphedoema can be provided through the administration of vascular endothelial growth factor C (VEGF-C) and vascular endothelial growth factor C (VEGF-C) and vascular endothelial growth CC factor D VEGF-D genes (via gene therapy) and proteins. The present cyc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method for inducing angiogenesis in a tissue, or area, in need of angiogenesis, in a mammal. The method comprises administering recombinant vascular endothelial growth factor [(VEGF-D) or its angiogenically active fragment or mutant (I). The presents tequence represents the human VEGF-D protein, which can be used in the method of the invention (I) has cardiant and vasotropic activities, and is an angiogenesis inducer. The method can be used for inducing angiogenesis in a namemal. (I) is useful for treating various ischaemic conditions manifested by vascular insufficiency such as peripheral vascular disease, coronary artery disease or myocardial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence

Examination of the 3 polypeptides indicates that reading frame 2 can be region free of nonsense codons. FIGF is a c.fos-cdependent autocrine growth factor able to induce cell division cc entry and, when over-expressed, a transformed phenotype in cliptoblasts. It could be implicated in tumours and development. CC Recombinant FIGF can be produced in transformed host (e.g. CHO) cc cells. It can be used to identify its receptors and in an assay cf or the identification of agonists and antagonists. Antibodies craised against FIGF can be used to block the function of the can be used to block the function of the can be used to block the function of the can be used to block the function of the can be used to block the function of the can be used to block the function of the can be used to block the function of the can be used to block the function of the can be used to block the function of the can be used to block the function of the control of the can be used to block the function of the control of the contr

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               such as coronary artery disease, and inhibition of angiogenesis in the treatment of cancer or of diabetic retinopathy. It can also be used in the treatment of lung disorders to improve blood circulation in the lung and/or gaseous exchange between the lungs and the blood stream or to improve blood circulation to the heart and 02 gas permeability in cases of cardiac insufficiency, to improve blood flow and gaseous exchange in chronic obstructive airway disease, or to treat malabsorptive syndromes in the intestinal tract. Quantitation of VEGF-D in cancer biopsy specimens may be useful as an indicator of future metastatic risk. Antagonists can be used for treating e.g. conditions such as congestive heart failure, involving accumulations of fluid in the lung resulting from increases in vascular permeability. The products can also be used

CC which is an anglogenic protein of the invention. The angiogenic proteins cand the DNA sequences encoding them, are used to prevent, treat or cameliorate disease and to detect diseases, or susceptibility, by content of detecting mutations or the presence or amount of angiogenic protein content of particularly they are used to stimulate wound healing, consisted the format of damaged bone and tissue, and for repair of vascular tissue, consequences are used to stimulate wound healing, consequences in tumours and to treat inflammation (where associated with increased vascular permeability), diabetic retinopathy, rheumatoid contracts of proteins are also used to identify specific contents of proteins are also used to identify specific contents and targeting of proteins are also used to identify specific contemplated in and targeting of proteins for in vivo or in vitro diagnosis (including imaging) or for therapy (including when linked to e.g. a label corrections); and for immunotyping of cells, e.g. for detecting minimal residual disease or haematopoietic progenitor/stem cells. It is also contemplated that the sequences might be useful for treating a very wide residual diseases (viral, bacterial, fungal or parasitic); cancer; concertion of the normal seater of contemplated that the sequences might be useful for treating a very wide resource of the content of the normal seater.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Quantitation of VEGF-D in cancer biopsy specimens may be useful as an indicator of future metastatic risk. Antagonists can be useful treating e.g. conditions such as congestive heart failure, involving accumulations of fluid in the lung resulting from increases in vascular permeability. The products can also be useful treating the products of the lung resulting from the lung resulting from the products of the lung resulting from the l

The VEGF-D protein, compounds and antibodies, which can bind the protein, may be useful in, e.g. gene therapy and in treatment of inflammation and oedema. Vectors, containing the VEGF-D DNA, and VEGF-D DNA sequences may be used for screening for the compounds which bind to the VEGF-D protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
